

# [TAP:JPBQN] Logic Operators

```
Student one;
```

```
if (one != null && one.getYear() == 2) {  
    System.out.println(one.getName());  
}
```

- Which of the following results from the code?
  - A. Compiler error
  - > B. Run-time error
  - > C. There's no error, but nothing is printed.
  - > D. A name is printed.
  - E. Whatever

**Instructors**

**Bill Jannen & Jon Park**

# Administrative Details

- Lab 1 handout is now online
- Prelab (=should be completed before lab):
  - Set up accounts
  - Complete Lab 1 design doc
    - Take a look at the example

# Crash Course in Java

- ⊙ Variables "content word" school nice ... x
- Operators "function word" is +
- Expressions "phrase" very nice x+3
- Statements "sentence" x = x + 3;

# Variable Types

- Primitive Types:
  - *true/false* boolean, *letter* char, *\** byte, short, int, long, *\*.f* float, double
- Objects : *extend Object*
  - arrays *String[] args*
    - Holds values of a single type
  - (class-based) Objects
    - Can hold information (fields)
    - Can specify behaviors (methods)

# (General) Operators

- Unary *1 argument*
  - Arithmetic: +, -, ++, -- (prefix and postfix)
    - $(++x)$   $x = x + 1$
    - $(x++)$   $x += 1$
  - Logical: !
- Binary *2 args*
  - Arithmetic: +, -, \*, /, %
  - Relational: ==, !=, <, <=, >, >=
  - Logical: &&, || *short-circuit eval* *if (denom != 0*  
*do num / denom)*
  - Assignment: =, +=, -=, \*=, /=, %=
- Ternary *3 args*  $x == y ? \text{"equal"} : \text{"different"}$ 
  - booleanCondition ? value1 : value2

# Operator Precedence in Java

| Operators            | Precedence  |
|----------------------|---|
| postfix              | <i>expr</i> ++ <i>expr</i> --                                 |
| unary                | ++ <i>expr</i> -- <i>expr</i> + <i>expr</i> - <i>expr</i> ~ ! |
| multiplicative       | * / %   |
| additive             | + -   |
| shift                | << >> >>>   |
| relational           | < > <= >= instanceof  |
| equality             | == !=   |
| bitwise AND          | &   |
| bitwise exclusive OR | ^   |
| bitwise inclusive OR |   |
| logical AND          | &&  |
| logical OR           |   |
| ternary              | ? :   |
| assignment           | = += -= *= /= %= &= ^=  = <<= >>= >>>=                        |

use  
()

# Crash Course in Java

- Variables
- Operators
- ⊙ Expressions
- Statements

# Expressions

2, "Jon" Math.pow(2, 3)

Sequence of variables, literals, method calls & operators that evaluate to a value

- An expression returns a value

- $3+2*5$

- "Your score is " + 100

- $i \leq \text{students.length}$

boolean expression

$x=1$  •  $(x++)$   $x=2$

$x=1$  •  $(++x)$   $x=2$

- Note, an assignment expression also returns a value

- $y = 4 * (x = 3)$  //  $x=3$   $y=12$ .

- `while ((line = reader.readLine()) != null){`

- `//do something with the line`

- `}`

# [TAP] Pre- and Post-increment

X = ~~10~~<sup>12</sup>;

System.out.println(~~(X++)~~<sup>10</sup> \* ~~(++X)~~<sup>12</sup>);

X = ~~10~~<sup>12</sup>;

System.out.println(~~(++X)~~<sup>11</sup> \* ~~(X++)~~<sup>11</sup>);

- Which of the following are outputted?
  - A. 100 & 100
  - > B. 110 & 110
  - > **C. 120 & 121**
  - ~~D. None of the above~~
  - E. Whatever

# Crash Course in Java

- Variables
- Operators
- Expressions
- ⊙ Statements

# Statements

- Statements

- `int x;`
- `x = 3;`
- `System.out.println("Hello, CS136!");`
- `if (x > 3) { ... } else { ... }`
- `while (x < 2) { ... }`
- `for (int i = 0; i < x; i++) { ... }`

*Control  
flow  
statement*

# Control Flow Statements

Select next statement based on a boolean expression.

- Branching structures: if, if/else, switch
- Looping structures: while, do-while, for

# If/else

Example: Encode clubs, diamonds, hearts, spades as 0, 1, 2, 3

```
if (x == 0 || x == 2) {  
    System.out.println("Your card is red");  
}else if (x == 1 || x == 3) {  
    System.out.println("Your card is black");}  
else {  
    System.out.println("Illegal suit code!");  
}
```

# switch

Example: Encode clubs, diamonds, hearts, spades as 0, 1, 2, 3

```
switch (x) {  
    case 0:  
    case 2:  
        System.out.println("Your card is red");  
        break;  
    case 1:  
    case 3:  
        System.out.println("Your card is black");  
        break;  
    default:  
        System.out.println("Illegal suit code!");  
        break;  
}
```

# while & do-while

Example: Count # of flips until “heads”

```
Random rng = new Random();
```

```
int flip, count = 0;
```

```
(flip = rng.nextInt(2); // returns 0 or 1
```

```
count++;
```

```
while (flip == 0) {
```

```
(flip = rng.nextInt(2);
```

```
count++;
```

```
}
```

VS

```
do {
```

```
flip = rng.nextInt(2);
```

```
count++;
```

```
} while (flip == 0);
```

# for & for-each

Example: Compute the average of test scores

```
int[] grades = { 100, 78, 92, 87, 89, 90 };
```

```
int sum = 0;
```

```
int i = 0;
```

```
while ( i < grades.length ) {
```

```
    sum += grades[i];
```

```
    i++;
```

```
}
```

```
ave = sum/grades.length;
```

while ( exp )

for ( ; exp ; )

VS

```
for( int i = 0; i < grades.length; i++ )
```

```
    sum += grades[i];
```

VS

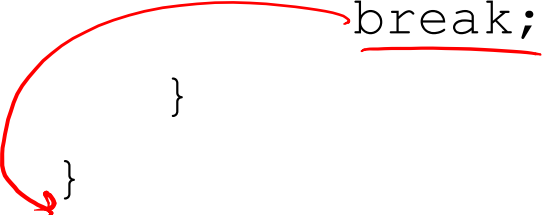

```
for (int g : grades)
```

```
    sum += g;
```

# break & continue

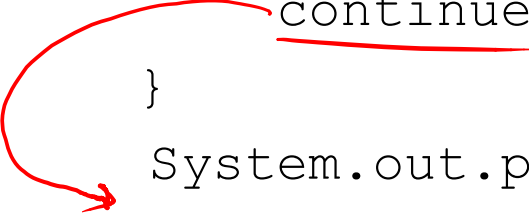

**break (Print the first prime between 100 and 200)**

```
for( int i = 100; i <= 200 ; i++ ) {  
    if ( isPrime(i) ) {  
        System.out.println( i );  
        break;  
    }  
}
```

**continue (Print all even # between 100 and 200)**

```
for( int i = 100; i <= 200 ; i++ ) {  
    if (i%2 = 1){  
        continue;  
    }  
    System.out.println( i );  
}
```

# Crash Course in Java

- Variables
- Operators
- Expressions
- Statements
- ⊙ Object-oriented Programming

# Object-Oriented Programming

- OOP is a programming paradigm, where a program is a set of objects interacting with one another.

## Variable Types

- Primitive Types:
  - *true/false* boolean, *letter* char, *\** byte, short, int, long, *\*.f* float, double
- Objects : *extend Object*
  - arrays *String[] args*
    - Holds values of a single type
  - (class-based) Objects *member*
    - Can hold information (fields), *instance var*
    - Can specify behaviors (methods), *function*

# OOP Example

Goal: Keep track of babies at a nursery; for each baby, keep this info: name and age.

Non-oop

String[] names

int[] age

OOP

Baby

name

age

```
public class Baby {  
    private String name;  
    private int age;
```

instance  
var

```
private static String nursery;  
Baby a = new Baby(18, "Ben");  
int u = a.getAge();
```

constructor

Baby

```
public Student Baby(int theAge, String theName) {  
    age = theAge;  
    name = theName;  
}
```

method

```
public String getName() {return name;}  
public int getAge() {return age;}  
  
public void setName(String newName) {  
    name = newName;  
}  
  
public void setAge(int newAge) {  
    if (newAge > 0)  
        age = newAge;  
}
```

getter/  
accessor

setter/  
modifier

Baby

```
public static  
String getNursery() {  
    return nursery;  
}
```

# Access Modifiers

|                       | Same Class | Class in the Same Package | Any Subclass | Any Class |
|-----------------------|------------|---------------------------|--------------|-----------|
| > public              | Y          | Y                         | Y            | Y         |
| protected             | Y          | Y                         | Y            | N         |
| <i>None (package)</i> | Y          | Y                         | N            | N         |
| > private             | Y          | N                         | N            | N         |

Again, be as restrictive as possible!

# Revisiting Hello.java

```
public class Hello {  
    public static void main(String[] args){  
        System.out.println("Hello, CS136!");  
    }  
}
```
