## Python Activity 12: Looping Structures - FOR Loops

How do we look at each element in a sequence?

## **Learning Objectives**

Students will be able to:

Content:

- Motivate the use of loops
- Explain the syntax of a for-each loop
- Explain the use of accumulation variables.

#### Process

- Trace through for..loops, identifying how local variables are modified
- Write code that includes a for-each loop.
- Write code that uses accumulation variables.

### **Prior Knowledge**

• Lists, conditionals, input, expressions

### **Conceptual Model**

Closely examine the Python program below that uses only concepts we've learned so far.

```
Python Program
# Counts the occurrences of a string in a given list
wthr lst = ['sun', 'partial', 'partial', 'rain', 'rain']
print("List is:", wthr lst)
item = input("What item to count? ")
count = 0
if wthr lst[0] == item:
    count = count + 1
if wthr lst[1] == item:
    count = count + 1
if wthr lst[2] == item:
    count = count + 1
if wthr lst[3] == item:
    count = count + 1
if wthr lst[4] == item:
    count = count + 1
print("Occurrences:", count)
```

CM1. When this code runs, and the user enters 'rain', what might the output of the program be?

CM2. What would we have to do if we wanted to accomplish the same task for a longer list, perhaps:

```
['sun', 'partial', 'partial', 'rain', 'rain', partial, partial,
'rain', 'sun', 'rain']?
```

\_\_\_\_\_

## **Critical Thinking Questions**

1. Closely examine the Python program below.

```
# Counts the occurrences of a string in a given list
wthr_lst = ['sun', 'partial', 'partial', 'rain', 'rain']
print("List is:", wthr_lst)
item = input("What item to count? ")

count = 0
for wthr in wthr_lst:
    if wthr == item: # is our current element item?
        count = count + 1

print("Occurrences:", count)
```

- a. Circle the new keyword we haven't seen before. How many lines of code is this example?
- b. The output from this program will be identical to that of the previous example, except it will work for a list of *any length* as well. Why might that be?
- c. What might the for keyword do?
  - **FYI:** A **looping structure** allows a block of code to be repeated one or more times. A **for** loop is one of the two looping structures available in Python. This particular example of for..loop is known as a **for-each loop**, as it **iterates** (or loops over) each of the items in a sequence (e.g., each character in a string).
- d. How does the Python interpreter know what lines of code belong to the loop body? (or, why doesn't Python print "Occurrences" several times?)
- e. Every for..loop structure requires certain syntax. Identify the part of code in the Python program that corresponds to each of these syntax requirements.
  - A keyword that indicates the beginning of the for..loop:
  - *A loop variable* that represents each element in the sequence as python loops:
  - A sequence to loop over:
  - *An operator that indicates the test condition between the loop variable and the sequence:*
  - An operator that indicates the end of the for..loop definition:

	FYI: An accumulation variable "accumulates" values in a loop structure.
0-	f. What is the accumulation variable in the above example?
2.	Examine the following interactive python interaction:
pixels	_favs = ['cheese', 'whipped cream', 'ice cream', 'jerky']
for fo	od in pixels_favs:
pri	nt(food)
a.	What kind of loop is this?
b.	Identify the part of code in the Python program that corresponds to each
	of the forloop syntax requirements.  • A keyword that indicates the beginning of the forloop:
	<ul> <li>A loop variable that represents each element in the sequence as python loops:</li> </ul>
	• A sequence to loop over:
	<ul> <li>An operator that indicates the test condition between the loop variable and the sequence.</li> </ul>
c.	Is there an accumulation variable in the above example?
d.	What does the loop variable food represent?
	Where is food assigned its value(s)?
3. Exam	ine the following code:
	Python Program
	<pre>items = ['choc chip', 'nilla', 'oreo', 'oatmeal', 'shortbread']</pre>
	count = 0
	<pre>for it in items:     count = count + 1</pre>
	print(count, it, "AH AH AH")
0-	prince (counce, ic, in in in )
a. Wh	at is the output of this program? Trace through the values as they change:
	e the loop: items count it displayed/print()
Iterati	on 1:
Iterati	on 2:
Iterati	on 3:
Iterati	on 4:
Iterati	on 5·

# Application Questions: Use the Python Interpreter to check your work

Write a function containing all	on, vowel_seq	, that takes a lat original list	list of characte	ers as an argu ey appear:	ment and retu	rns a
Write a function containing all	on, vowel_seq the vowels in tha	, that takes a l t original list	ist of characte in the order th	ers as an argu ey appear:	ment and retu	rns a
Write a function containing all	on, vowel_seq the vowels in tha	, that takes a l t original list	list of characte in the order th	ers as an argu ey appear:	ment and retu	rns a
Write a function containing all	on, vowel_seq	, that takes a l t original list	list of characte in the order th	ers as an argu ey appear:	ment and retu	rns a
Write a function containing all	on, vowel_seq	, that takes a lat original list	list of characte in the order th	ers as an argu ey appear:	ment and retu	rns a
Write a function containing all	on, vowel_seq	, that takes a toriginal list	list of characte in the order th	ers as an argu ey appear:	ment and retu	rns a
Write a function containing all	on, vowel_seq	, that takes a l	list of characte in the order th	ers as an argu ey appear:	ment and retu	rns a
Write a function containing all	on, vowel_seq	, that takes a toriginal list	list of characte	ers as an argu	ment and retu	rns a
Write a function containing all	on, vowel_seq	, that takes a toriginal list	list of characte	ers as an argu ey appear:	ment and retu	rns a
Write a function containing all	on, vowel_seq	, that takes a toriginal list	list of characte	ers as an argu	ment and retu	rns a
